

The background of the slide is a light gray grid. Overlaid on the grid is a stylized topographic map with blue contour lines. A prominent blue line, representing a route, winds across the map, marked with small blue diamond-shaped nodes at various points.

EVN HyperLogistics: Deterministic AI for Middle-Mile Freight

Delivering safety-compliant, explainable AI rerouting.

Prediction

Helvetica Now Display

7.7M

US accident records.

Multi-TB NOAA
weather data feeds.

Current tools detect risk in real-time but
leave operators stranded with raw data.

The Prediction-to-Action Gap

Action

Helvetica Now Display

Safe, explainable, and compliant
reroutes ready for dispatch.

Middle-mile teams face immense pressure during disruptions.
Without trustworthy AI, prediction cannot safely cross the gap into action.

Short-Horizon Disruption Propagation Forecasting

4-8

hour forecasting window.

Legacy tools only see the disruption as it happens. SRSNet forecasts short-horizon disruption propagation, allowing operators to route freight around the ripple before it impacts the network.

Built as a highly deployable enterprise platform. Learning and rigid rules are combined in a single inference architecture operating close to the data.

Spatial SQL Guardrails /
600K+ Bridge Constraints

100%
bridge-constraint
enforcement.

HyperLogistics blocks physically invalid routes before they reach the operator. Unsafe probabilistic outputs are rejected, converting AI reasoning into compliance-ready action.

User Persona Alignment & Metric Validation

100 synthetic manager query-response pairs.

The interface is aligned to real user language and scenarios. Recommendations are delivered with auditable justification, enabling faster decisions without sacrificing operational defensibility.

Freight routing operates in a highly disruptive environment bound by non-negotiable **physical laws**. Generic AI models cannot reliably navigate **structural limits** like bridge clearances and load weights.

	Legacy Routing Tools	Standard AI Co-pilots	EVN HyperLogistics
Real-Time Disruption Detection	✓	✓	✓
Route Forecasting	✗	✓	✓
Explainable Reasoning	✗	✓	✓
Deterministic Safety / Hard Veto	✗	✗	✓

While standard AI adds probabilistic reasoning, only EVN possesses the Deterministic Safety Veto required to make AI outputs physically and legally viable for freight.

Model Lift

Accuracy Lift

Domain adaptation improved accuracy from 40% to 95%.

Reproducibility

Audit Pass

ReMindRAG reproducibility audit passed perfectly, with 14/14 identified issues resolved.

Deployment

Safety Enforcement

Live HyperLogistics deployment actively rejecting physically invalid routes.

Rigorous auditing proves execution quality and engineering reliability, transforming conceptual progress into proven momentum.

The base subscription fixes immediate operational pain, while the integrated 9-tool analytics agent drives continuous account expansion and deeper ops intelligence.
